# Drug viability screens for oncological and non-oncological treatments for breast cancer

Data Science Project Summer Semester 2023

Topic 5 Team 4

Submission date: 17.07.2023

Luis Herfurth, Aaron Eidenmüller, Sharujan Suthakaran, Simon Westermann

# Abstract

Hier muss das Abstract eingefügt werden

## Abbreviations

# 1 Introduction

## 2 Materials and Methods

### 2.1 Data

#### 2.1.1 Prism Datasets

**Prism:** effect of the treatment (columns) on cell growth of the cell lines (rows); includes drug, dosage and assay used

**Prism.treat:** for each treatment (rows) further information on the treatment and drug

**Prism.cl:** contains information about the different celllines

*if we search after "breast" in the column lineage we get our 22 celllines*

#### 2.1.2 Cellline Datasets

**Prism.exp:** contains levels of gene expression. Celllines (rows) and genes (columns)

**Prism.cnv:** contains copy number levels of genes. Normal is  $CN = 2$ . Gene names (rows) and celllines (columns)

**Prism.snv:** marks mutation in the different celllines als functional or nonfunctional to the cancer.

**Prism.achilles:** has information on how important a gene is for cell survival. Was generated using knockdown celllines. Gene names (rows) and celllines (columns)

### 2.2 Data clean up/Filtering

Show distributions after cleanup Abbildung für prism vorher nachher. Für andere maybe im Clean up

### 2.3 imension reduction

UMAP -> PCA wird rausgelassen; Plot den Luis gemacht hat. Ist nicht geclustert, aber man kann erkennen, dass die MOA sich in den gleichen areas aufhalten

### 2.4 Clustering

kmeans -> Simon hat welche gemacht, aber die sehen kacke aus => Anna fragen

### 2.5 Statistical test

Wilcoxon test 0.05 alpha p adjust needed wegen sehr viele berechnungen und hoher fdr deswegen Shapiro Wilk

## **2.6 Linear Regression**

Prediction tool

## **3 Results**

First include positiv results; if space is left include negativ results: UMAP, K means clustering, promoting drugs describe goal, describe process, describe outcome

### **3.1 Gene search engine**

Goal: Arbeitsvereinfachung; Outcome: Overview over data Für Präsentation als Visualisierungstool  
pitchen Maybe Website

### **3.2 List of inhibitory drugs**

Results von Data clean up und filtering. Goal: List of Inhibitory Drugs; Outcome: List of Inhibitory Drugs Bilder vergleich liste vergleich ohne threshold und mit threshold Maybe oncological drugs rein screenen

### **3.3 Gene analysis**

#### **3.3.1 Correlation analysis**

treatment response / gene expression; Goal: finding relevant genes; Outcome: giant data frame -> used for further work

copy number / gene expression Goal: looking if hypothesis correct; Outcome: Histogram of correlations

#### **3.3.2 Dataframe for targets involving genes**

mean of data frames. Threshold for what genes are relevant. Used indings from correlation tests Goal: finding interesting genes; Outcome: Data frame with many genes -> 48 genes data set with filtering after gene knockout score

#### **3.3.3 Statistical testing of important genes**

Test wich of the found genes are for breast cancer of interest Goal: find out which one are negativ, which ones are lower than other lineages; Outcome: 2 genes

### **3.4 Linear regression**

Perform drug by drug to avoid weird plot; For every drug one linear regression,  $R^2$  Value and with those showing, that many of them are very good. Prediction model for concentration and drug name. Plot um das gnaze zu veranschaulichen; Goal: Regression/Prediction model; Outcome: Regression/Prediction model

## **4 Discussion**

Search for papers mentioning certain genes found in the targets of the inhibitory drugs or

## **5 References**

## **6 Appendix**
